

## Environment and CO2

- Frode Laursen is very aware that as a logistic company we have a great impact on the environment – especially through CO2 emission.
- Our main goal is to reduce Frode Laursen's environmental impact, measured in CO2 emission, with no less than 20 % from 2005 to 2015 – adjusted for real growth.
- Frode Laursen considers a responsible behavior towards a sustainable environment, as an integrated part of our business philosophy.

We have therefore singled out a series of goals and initiatives which we want to carry out in close cooperation with business associates and employees.

The goals and initiatives are as follows:

- Driving courses for reducing fuel consumption – education
- Renewal of trucks – class 5 diesel engine
- Fill up the trucks e.g. by consolidating the goods
- Joined facilities – Multishare warehouses
- Planning – improved level of information in order to limit unnecessary driving
- Sustainability – as an integrated part of the development of logistic models for our business customers
- Alternatives to road transport
- Focus on energy consumption for our warehouses
- Road trains and special trailers with high capacity

Frode Laursen works towards our goals by:

- Ensuring knowledge of environmental sustainability at:
  - Management
  - Employees with customer contact
  - Drivers
  - Other employees
- Incorporating environmental efficiency when:
  - Signing new customer agreements
  - Investing in new equipment and buildings
  - Contracting with suppliers
  - Selecting logistic solutions

Environmental and CO2 awareness is an ongoing process, in which we're continuously focussed on improving our knowledge through studying the best examples and solutions from the industry. Furthermore we actively participate in European fora, where sustainability within our line of business is developed.
